                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO337, PRO1559, PRO725, PRO700 or PRO739 polypeptide, and for PRO4993, PRO337, PRO1559, PRO725, PRO700 or PRO739 polypeptide. Inking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
                                                                                                                                                                                                                                                                                                                                   primer; ss; inflammatory disease; organ failure; atherosclerosis; cardiac injury; infertility; birth defect; premature aging; AIDS; diabetic complication; tissue typing; human; PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

New PRO polypeptides useful neuropathies associated with or AIDS-associated ---
     The present invention relates to the isolation of novel human polypeptides, and the polynucleotide sequences encoding them. polypeptides are secreted and transmembrane proteins. The PRO

The bioactive molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refsum's disease, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ss; PCR; sécreted protein; transmembrane protein; PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18-DEC-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ADC43894

Novel secreted and transmembrane polypeptides and polynucleotides encoding them, useful for treating wound healing, tissue growth and muscle generation and regeneration, amyotrophic lateral sclerosis o 9

Example 40; SEQ ID NO 246; 472pp; English

The invention describes an isolated secereted and transmembrane PRO colypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various condustrial applications. PRO polypeptide such as PRO300, PRO866, PRO703, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO653, PRO6060 or PRO606 is useful for therapeutic purposes. PRO363 is useful cherapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and compuse generation and regeneration. PRO37 is useful for treating campotrophic lateral selerosis, neuropathy. AIDS-associated neuropathy or diabetic peripheral neuropathy. A polynucleotide (II) encoding (I) is useful for generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful creating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful creating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful creating as probes for generating a pool of sequences for identifying related PRO coding sequences, and to construct hybridisation probes for reagents, as probes Luigherelated PRO coding sequences, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mapping the gene which encodes the PRO and for the genetic analysis of individuals with genetic disorders, for recombinantly expressing (I) and for chromosome identification. (I) is useful as molecular marker for protein electrophoresis purposes, and as therapeutic agents. (I) is also useful for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists) are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. This sequence represents a human seceretd and transmembrane PRO protein associated primer.

New isolated secreted and transmembrane PRO polypeptides, useful in the preparation of a medicament for treating a condition responsive to the polypeptide, and as therapeutic agents e.g. vaccines.

Example 40; SEQ ID NO 246; 467pp; English.

The invention relates to an isolated PRO polypeptide (secreted or cransmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal compitide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising CR PRO fused to a heterologous amino acid sequence, and an anti-PRO crantibody. PRO37 polypeptide is useful for detecting a PRO493 polypeptide. CS inilarly, PRO493 polypeptide is useful for detecting PRO37 collypeptide, and prod559 polypeptide. TRO739 polypeptide is useful for detecting PRO375, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO493 polypeptide is useful for detecting PRO725, PRO700 or PRO39 polypeptide is useful for detecting CRO1559 polypeptide, and PRO493 polypeptide is useful for inking a CRO1559 polypeptide, and PRO493 polypeptide is useful for inking a CRO1559 polypeptide to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody The bioactive molecule

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide) a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. PRO735, PRO700 or PRO739 polypeptide is useful for detecting PRO377 polypeptide, and PRO1559 polypeptide is useful for detecting PRO37 detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel secreted and transmembrane polypeptides, designated PRO polypeptides, and polynucleotides encoding them useful for treating kidney diseases, bone, cartilage and retinal disorders.

Novel isolated secreted and transmembrane PRO polypeptides, useful preparation of a medicament for treating a condition responsive to polypeptide, and as therapeutic agents e.g. vaccines. in t the

Example 40; SEQ ID ŏ 246; 466pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence as given to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO, a chimaeric molecule comprising PRO, a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO, a protein surformed to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting PRO337

                                                                                                                                                                                                                                                                                       The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO300, PRO866, PRO703, PRO319, PRO321, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO8660 or PRO846 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated secreted and transmembrane PRO polypeptides, useful preparation of a medicament for treating a condition responsive to polypeptide, and as therapeutic agents e.g. vaccines.

Human

PRO

871

PCR

primer

```
Ct transmembrane protein) having at least 80% mains caid sequence identity

Ct to an amino acid sequence chosen from 94 fully defined sequence as given

CC in the specification (including PRO lacking its associated signal

CC peptide, a PRO extracellular domain with or without its associated signal

CC mentioned above, a vector comprising a PRO mucleic acid), a host cell

CC comprising the vector and producing PRO, a chimaeric molecule comprising

CC PRO fused to a heterologous amino acid sequence, and an atti-PRO

CC antibody. PRO337 polypeptide is useful for detecting a PRO4993

CC polypeptide in a sample suspected of containing PRO4993

CC polypeptide. PRO722, PRO700 or PRO739 polypeptide is useful for detecting

CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting

CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for clarities

CC causes death of the cell. PRO337 polypeptide is useful for linking a

CC bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a

CC polypeptide or PRO739 polypeptide is useful for linking a

CC polypeptide is the toxin, radiolabel, or an antibody. The bicactive molecule

CC causes death of the cell. PRO337 polypeptide is useful for linking a

CC pro700 or PRO739 polypeptide are useful for linking a

CC polypeptide or anti-PRO493 polypeptide; and PRO1559 polypeptide; PRO725,

CC polypeptide or anti-PRO493 polypeptide, and PRO1559 polypeptide; PRO725,

CC polypeptide or anti-PRO493 polypeptide, and PRO1559 polypeptide; PRO725,

CC polypeptide or anti-PRO493 polypeptide, where the cell expressing PRO37

CC polypeptide is useful for modulating at least one biological activity of

CC polypeptide is useful for modulating the softled is useful for

CC polypeptide; and PRO1559 polypeptide, where the cell is killed, PRO337

CD polypeptide is useful for modulating the biological activity of

CR pro700 or PRO739 polypeptide or anti-PRO755, anti-PRO700 or anti-

CC polypeptide is useful for modulating the biological activity of

CC pro

The invention relates to an isolated PRO polypeptide (secreted or cransmembrane procein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given cin the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins comprising the vector and producing PRO, a chimaeric molecule comprising PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising properties in useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for lacking a producing producing PRO4993 polypeptide. The bloactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a consect death of the cell. PRO337 polypeptide is useful for linking a ploactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a consect death of the cell. PRO337 polypeptide is useful for linking a ploactive molecule to a cell expressing PRO4993 polypeptide; where the cell expressing PRO337 polypeptide, and PRO1559 polypeptide is useful for linking a polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide, where the cell is killed. PRO337 polypeptide, where the cell is killed. PRO337 polypeptide, where the cell is killed. PRO337 polypeptide or anti-PRO393 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide or anti-PRO3030 pol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ashkenazi AJ

sports-related joint problems, articular cartilage defects,
osteoarthritis or rheumatoid arthritis, wound healing and hearing
mammals. The present sequence is a PCR primer used to isolate nucl
acid encoding a PRO protein.
                       The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss, PCR; secreted protein; transmembrane protein; PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis;
  peptide, a peptide). 1
                                                                                                                                                                                                                                           New PRO genes and encoded secreted and transmembrane polypeptides, to for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, hypoinsulinemia or
                                                                                                                                                                        Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ashkenazi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18-OCT-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising CC pRO fused to a heterologous amino acid sequence, and an anti-PRO CC antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. CC Similarly, PRO4993 polypeptide is useful for detecting PRO337 CC polypeptide in a sample suspected of containing PRO4993 polypeptide. CC polypeptide is useful for inking a CC polypeptide, and PRO1559 polypeptide is useful for inking a CC pRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC pro725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO725, CC pRO700 or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 CC polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide, where the cell is killed. PRO337 polypeptide or anti-PRO4993 polypeptide, where the cell is killed. PRO337 CC polypeptide; and PRO4993 polypeptide; pRO725, PRO700 or PRO739 polypeptide or anti-PRO539 polypeptide or anti-PRO559 polypeptide; where the cell is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide; where the cell is killed. PRO337 cc polypeptide; and PRO559 polypeptide or anti-PRO725, anti-PRO730 or PRO739 polypeptide or anti-PRO559 polypeptide; or anti-PRO725, anti-PRO700 or anti-PRO559 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO559 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO559 polypeptide or anti-PRO700 or PRO739 polypeptide is useful for modulating the biological activity of the cell express
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

New secreted and transmembrane PRO nucleic acids and polypeptides, useful for stimulating the release of tumor necrosis factor alpha from human blood and stimulating the proliferation of differentiation of chondrocyte

SEQ No 246; 462pp; English

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence and sequence identity to an amino acid sequence consent from 94 fully defined sequences a given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting PRO377 polypeptide is useful for detecting PRO3159 polypeptide, and PRO1559 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for linking a polypeptide is the toxin, radiolabel, or an antibody. The bioactive molecule to a cell expressing PRO493 polypeptide; PRO725, pRO700 or PRO739 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; PRO725,

```
CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule Ct to a cell expressing PRO1559 polypeptide; and PRO1559 polypeptide is CC useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide, where the cell is killed. PRO337 polypeptide or anti-PRO4993 polypeptide is useful for modulating the CC biological activity of the cell expressing PRO4993 polypeptide is useful for modulating the biological activity of the cell expressing PRO4993 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide or an anti-PRO1559 polypeptide; PRO755 polypeptide; and PRO1559 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO7039 polypeptide; are useful for modulating the biological activity of the cell expressing PRO4993 polypeptide. The CC polypeptides are useful for inhibiting tumour growth, retinal disorders, CC sports-related joint problems, articular cartilage defects.

CC consumals. The present sequence is a PCR primer used to isolate nucleic and manuals. The present sequence is a PCR primer used to isolate nucleic
                                                          encoding a PRO protein.

RESULT 113
ADE48580/c
CC transmembrane protein) having at least 80% amino acid sequence identity coin the specification (including PRO lacking its associated signal copptide, a PRO extracellular domain with or without its associated signal comprising a PRO extracellular domain with or without its associated signal comprising the vector comprising PRO, a chimacric molecule comprising CC mentioned above, a vector comprising PRO, a chimacric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting CC process death of the cell. PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a cC pro700 or PRO739 polypeptide are useful for linking a cc pro700 or PRO739 polypeptide is useful for linking a cc pro700 or PRO739 polypeptide is useful for linking a cc pro700 or PRO739 polypeptide is useful for linking a cc pro700 or PRO739 polypeptide is useful for linking a cc pro700 or PRO739 polypeptide is useful for linking a cc pro700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; pro725, cc polypeptide or anti-PRO493 polypeptide, and PRO159 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO725, cc polypeptide or anti-PRO37 polypeptide, where the cell is killed, PRO37 cplypeptide, and PRO159 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO725, anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, anti-PRO700 or anti-PRO739 polypeptide; and PRO725, anti-PRO700 or anti-PRO739 polypeptide; and profice is useful for modulating the biological activity of the cell expressing PRO725, anti-PRO700 or anti-PRO739 polypeptide; and profic

New isolated nucleic acid encoding a PRO polypeptide, PRO337, useful in molecular biology, chromosome and generating antisense RNA and DNA, and in gene therapy gene ი ფ. mapping, PRO4993 in

Example 40; SEQ ID NO 246; 460pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC polypeptide in a sample suspected of containing PRO4993 polypeptide. CC Similarly, PRO4993 polypeptide is useful for detecting PRO337 CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting CC PRO1259 polypeptide, and PRO1559 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a CC causes death of the cell. PRO337 polypeptide is useful for linking a CC pro700 or PRO739 polypeptide are useful for linking a Dioactive molecule to a cell expressing PRO337 polypeptide; PRO705, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide or anti-PRO337 CC pro700 or PRO739 polypeptide. PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide or anti-PRO337 CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide, where the cell is killed. PRO337 CC polypeptide or anti-PRO4993 polypeptide is useful for modulating the CC polypeptide; and PRO1559 polypeptide is useful for modulating the CC polypeptide; and PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, CC polypeptide; and PRO1559 polypeptide or an anti-PRO75, anti-PRO700 or anti-PRO739 polypeptide; PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 CC polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 ccl profile is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide. PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide. PRO700 or anti-PRO739 polypeptide. PRO700 or anti-PRO739 polypeptide. PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or ant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     멂

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (FILV/)

                                                                 relates to a method for treating or preventing non-insulin dependent diabetes mellitus (NIDDM) or other conditions associated with impaired glucose tolerance such as obesity using phytanic acid or its derivatives. The phytanic acid, their derivatives or their precursors are useful as pharmaceutical compounds or supplements to foods or feeds for the treatment or prevention of type II or NIDDM, hyperlipidaemia, hyperinsulinaemia, syndrome X, hypertension, hypertension impaired glucose tolerance and related obesity. They are also useful in insulin therapy in combination with known active compounds. The present sequence is apolipoprotein E (ApoE) cDNA amplifying reverse transcription PCR (RT-PCR) primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hyperlipidaemia; hypertension; insulin therapy; hypercholesterolaemia; hypertriglyceridaemia; primer; apolipoprotein E; RT-PCR; ApoE; reverse transcription PCR; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libbraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising phytanic acid or its derivatives, useful for treating or preventing non-insulin dependent diabetes mellitus, impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19 BP; 1 A; 7 C; 3 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the use of phytanic acid or its derivatives the treatment or prevention of diabetes mellitus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                  CC PCR primers AAZ21589-Z21594 are used to amplify the HIV integrase cDNA.

CC This primer corresponds to nucleotides 4016-4036 of the integrase

CC sequence. The HIV integrase (IN) cDNA was used in the generation of an L-

CC chicoric acid resistant strain of HIV. The invention relates to new

CC compounds that are IN inhibitors. The inhibitors are novel compounds that

CC compounds that are in inhibit HIV integrase. The inhibitors are

CC structural analogues of bis-(3,4-Dihydroxycinnamoyl) tarraric acid.

CI Integrase has the minimal activities needed for integration. In vitro the

CC enzyme processes the HIV DNA for insertion in to the host cell's nucleus.

CC IN also cleaves double stranded DNA and facilitates the insertion of the

CC HIV DNA in to the cleavage site. IN also covalently links the HIV DNA to

CC the cleaved ends of the host DNA. The new compounds hock the actions of

CC IN, and therefore block viral replication. The compounds are synergistic

CC with reverse transcriptase and protease inhibitors, acting at a different

CC part of the HIV replication cycle. The new inhibitors are used,

CC preferably in combination therapy with reverse transcriptase inhibitors

CC and protease inhibitors in the treatment of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer; HIV; integrase; IN; inhibitor; DNA insertion; treatment; viral replication; reverse transcriptase; protease inhibitor; combination therapy; resistant strain; ss.

The present invention describes recombinant human EPO which causes bone marrow cells to increase production of reticulocytes or red blood cells, where the polypeptide is the product of expression in CHO (Chinese hamster overy) cells of an exogenous DNA sequence encoding human EPO. EPO is potentially useful in the diagnosis and treatment of blood disorders characterised by low or defective red blood cell production

Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO polymucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antibodies specific for PRO polypeptides, used to diagnose and the growth of tumors in mammals, and to identify inhibitors of polypeptide activity or expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to secreted and transmembrane protein These proteins and the DNA encoding them may be used as hybridizat probes, in chromosome and gene mapping and in the generation of an sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful fo development and screening of therapeutically useful reagents. The acids may also be used in gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteomaliacia and fibrous dysplasia. ABA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20-NOV-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     JP2001321190-A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                            The invention describes a labeled polynucleotide probe that is partly hybridisable with a polyadenine nucleotide moiety of a target nucleic acid. The method discussed in the invention is useful for the detection of nucleic acids in gene engineering, biochemistry and medicine. This sequence represents a PCR primer used in the amplification of onco-genes and associated with the polynucleotide probes discussed in the invention
                                                                                                                                                                                                                                                                                                                                             Detection of nucleic acids, useful in gene engineering, biochemistry and medicine, comprising a labeled polynucleotide probe partly hybridizable with a polyadenine nucleotide moiety of a target nucleic acid,.
                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    05-JUL-2000; 2000JP-00204177.

                                                                                                                                                                                                                                                                                                          The invention relates to a method for identifying a molecule involved in clipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type companies identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-cassociated conditions, including arteriosclerosis, cardiovascular conditions, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmaxl and HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDMA molecules encoding human Zmaxl and HBM, and PCR primers, probes, linkers and adapters of the invention

                                                                                                  The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (I) has antisnflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represent a mouse caspase 7 inhibiting chimeric phosphorothicate or consignuclectide having 2 hyper and a deoxy gap, which is used in an example form the present invention.
                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compounds targeted to nucleic acids encoding caspase for modulating gene expression and treating diseases associated with expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour; phosphorothioate; ss

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                    preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                           junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and uniquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

                                                                                                                           The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing CC an IRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The convention has osteopathic and cytostatic activity. The polymucleotides of the invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals and the species in more than one parameter selected from bone density, bone cransgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone compositions, which may be employed for treating or preventing bone compositions, which may be employed for treating or preventing bone compositions, osteoporosis, osteomalacia, rickets, paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is

The state of the s

```
The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like modulation. The invention is useful for diagnosing a HBM-like whenevers in a subject and for preparing a composition for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11-MAY-2001; 2001US-0290071P.

                                                                                                                                                                                        The invention relates to a novel DNA encoding a weed controller metabolism protein. A protein of the invention has herbicide activity. The proteins and their encoded genes are useful e.g. in constructing new breeds of herbicide-resistant plants and also in developing various agrochemicals. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                Weed controller metabolism proteins deactivating porphyrinogen (PPO)-inhibiting herbicides by N-demethylation and their genes, e.g. in constructing new breeds of herbicide-resistant plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human PRO polypeptides and the polynucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for protein electrophoresis and as therapeutic agents. The polynucleotides are useful as hybridisation probes for a cDNI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequences as CC given in the specification (including their extracellular domains either cor without their associated signal peptides. Also include are the nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a CC comprising PRO fused to a heterologous amino acid sequence, and an anticell comprising the vector, producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anticell comprising PRO fused to a heterologous amino acid sequence, and an anticell comprising professis and also for chromosome identification. PRO is also useful for tissue typing. PRO and PRO NA are useful as hybridisation compressis and also for chromosome identification. PRO is also useful in development and screening useful reagents. PRO NA is also cuseful in gene therapy. PRO1244, PRO1264 and PRO1303 polypeptides are useful for suppressing immune response. PRO1246 cuseful for treating cancerous tumours. PRO1303, polypeptides are useful for suppressing immune response. PRO1246 complypeptide is also useful for streating tumours. PRO1246 and PRO1364 polypeptide is also useful for streating tumours. PRO1246 and PRO1364 polypeptide are useful for treating cardiac insufficiency disorders. CC PRO1246 polypeptides are useful for treating bone and/or cartilage disorders (e.g., arthritis) and wound healing. PRO1303, PRO1304 PRO1476 and PRO1479, PRO1265, PRO1244 and PRO1382 polypeptides are useful for treating disabetes in skeletal muscle cells and observe, PRO1255, PRO1244 and PRO1382 polypeptides are useful for treating disabetes in skeletal muscle cells and observe, PRO1255, PRO1244 and PRO1308, PRO1306, PRO1416, PRO1410, PRO1410, PRO1306, PRO1410, PRO14106, PRO14106.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

GENENTECH INC.

Baker KP, Botstein I Gao W, Goddard A, C Pan J, Paoni NF, Rc Williams PM, Wood W in D, Desnoyers I, Godowski PJ, (Roy MA, Smith Wi, s L, Eaton DL, Grimaldi JC, (h V, Stewart TA. DL, Ferrara N, C, Gurney AL, t TA, Tumas D, , Fong S; Hillan KJ; , Watanabe CK;

2003-708395/67.

Novel secreted preparation of polypeptide and and and transmembrane a medicament for t d as therapeutic aç ne PRO polypeptides us r treating a condition agents e.g. vaccines. useful ion resp eful in the responsive ť PRO

Example 143; SEQ IJ Ö 447; 555pp; English.

The invention transmembrane relates t to an isolated PRO polypeptide (secreted) having at least 80% amino acid sequence or identity

The methods and compositions of the present invention are useful for treating disorders associated with hydroxysteroid 11-beta dehydrogenase 1 expression, such as osteoporosis, depression and metabolic disorders like obesity, diabetes, atherosclerosis and hyperlipidaemia. This sequence represents an antisense oligonucleotide used to control the expression of mouse hydroxysteroid 11-beta dehydrogenase 1
                                                                                                                                                                                       Oligo JT-296

The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bioactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GL50; antigen; antigen presenting cell; T cell proliferation; tumour; graft-versus-host disease; autoimmune disease; allergy; viral infection; acquired immune deficiency syndrome; AIDS; vaccine; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel modified annexin useful for imaging vascular thrombi and apoptosis, has N-terminal chelation site comprising amino acid extension which comprises a glycine and a cysteine residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 5 A; 9 C; 4 G; 3 T; 0 U;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 12; 39pp; English.

                                              antigens on the surface of antigen presenting cells, which costimulate T cell proliferation and bind to costimulatory receptor ligands on T cells. GL50 modulating agents are used to modulate an immune response in a subject. GL50 polypeptides are used to modulate T cell costimulation, and to reduce the proliferation of a tumour cell. Diseases that can be treated using GL50 molecules are graft-versus-bost disease, autoimmune disease, allergies, acquired immune deficiency syndrome (AIDS), and viral infections. The GL50 molecules can be used in vaccines. GL50 polymucleotides can be used to locate gene regions associated with genetic disease, in tissue typing, and in forensic identification of a biological sample
